RAG :- Retrival Augmented Generation

RAG is not a single technology, its a technique which is used on models to increase the accuracy and quality of the answers/response given by the LLM.

How Does it work? :-

We allow our AI model / LLM to access an up-to date database or real time database, in which some relevant data is stored, which our model can access in real time. Eg:- data which is subject to change like flight status.

Then answers that will be generated will be more accurate, more up to date and context aware, means the model will have more context about the response.

Benefits of RAG:-

- It reduces Hallucinations ⇒ when agent gives incorrect false response
- Keep knowledge up to date ⇒ When model doesn't know about current events as it is trained on old data, we can overcome this with RAG.
- Cost Effective ⇒ We don't have to train or fine-tune the model.
- Maintain Data Privacy ⇒ As companies don't have to train model on a lot of data, so the model only access relative parts of the database
